Lab Link design concept

Construction by circulation mechanism between thought and society, between virtual reality and reality society .
Promotion of evolution by construction of spiral systems

We incorporate whole system that is based on the life law (love of life) .
We can lead holistic society that human being harmonized with nature.

Elucidation about physiology characteristics of human being

* Lab Link suggests value, faith, the lifestyle that much human being feel happiness as natural creature.
  the study of physiology characteristics of human being is most important.
* At present, physiology characteristics of human being is argued mainly in medical biology or a physiologic
  domain.
* If many researcher across various specialty domain elucidate physiologic characteristics of human being,
  all society system and all studies domain can unify. And We construct society that can apply to
  physiology characteristics of human being.

Creation of holistic society that human being can harmonize with nature

* Physiology pleasant feeling and unpleasantness are basics of the action choice of the natural creature.
* Body and mind connect by psychophysical modularity. That connects to society and nature closely.
* We research physiologic pleasant feeling. We offer article and service of experience and participation.
  When much human being consumes those, they can create society that human being can be harmonized with nature in
  lifestyle.

Suggestion of unification policy

* Combination of each element inside system and one of each part system is composition policy.
* We create unification policy by using matrix including various selection areas in the vision of long term.
  While unification and differentiation, self-organization and self-maintenance is repeated, whole system links to another
  one with spiral. Promotion of whole system with spiral creates toward harmonized evolution. We create unified business
  policy as base of whole system that aims holistic harmony.
* By using holistic approach, theory of network, system and process, we suggest the unification policy incorporated
  interdependence,   circularity, feedback,   spiral in each system.
